User’s Guide
Thank you...

Thank you for purchasing a Mark-10 Model 5i digital force / torque indicator, designed for use with interchangeable remote force and torque sensors. A 5i-sensor combination can be used with some Mark-10 test stands grips, and data collection software.

With proper usage, we are confident that you will get many years of great service with this product. Mark-10 instruments are ruggedly built for many years of service in laboratory and industrial environments.

This User's Guide provides setup, safety, and operation instructions. Dimensions and specifications are also provided. For additional information or answers to your questions, please do not hesitate to contact us. Our technical support and engineering teams are eager to assist you.

Before use, each person who is to use a Model 5i indicator should be fully trained in appropriate operation and safety procedures.

1.2 General Overview

The 5i is a universal indicator designed for displaying measurements from interchangeable Mark-10 Plug & Test™ sensors. Sensor capacities are available from 0.25 to 10,000 lbF (1 N to 50 kN) of force, and from 10 ozFin to 5,000 lbFin (7 Ncm to 550 Nm) of torque. These sensors can be handheld or mounted to a fixture or test stand for more sophisticated testing requirements.

Plug & Test™ sensors are used with the 7i, 5i, or 3i indicators. They may be disconnected from one indicator and connected to another without the need for re-calibration or re-configuration. All such data is saved within a PCB located inside the smart connector.

The model number, serial number, and capacity of the sensor are identified in the rectangular label located on the Plug & Test™ connector. The model and serial numbers are also identified in the Information screen of the indicator.

1.3 Accuracy and Resolution

Indicator accuracy must be combined with sensor accuracy to determine the total accuracy of the system. Since sensors may be used with the 7i, 5i or 3i indicators, the accuracy of the indicator being used must be identified and taken into account, as follows:

<table>
<thead>
<tr>
<th>Indicator Model</th>
<th>Accuracy</th>
</tr>
</thead>
<tbody>
<tr>
<td>7i / 5i</td>
<td>±0.1% of full scale</td>
</tr>
<tr>
<td>3i</td>
<td>±0.2% of full scale</td>
</tr>
</tbody>
</table>

The total system accuracy can be calculated by adding the sensor accuracy and indicator accuracy.

Refer to the following examples:
Example 1
*Model MR01-100 sensor with Model 5i Indicator*

<table>
<thead>
<tr>
<th>MR01-100</th>
<th>5i</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>±0.15%</td>
<td>±0.1%</td>
<td>±0.25%</td>
</tr>
<tr>
<td>of full scale</td>
<td>of full scale</td>
<td>of full scale</td>
</tr>
</tbody>
</table>

This translates into a fixed error of up to:

\[0.25\% \times 100 \text{ lbF} = 0.25 \text{ lbF}\]

Example 2
*Model MR50-50Z sensor with Model 3i Indicator*

<table>
<thead>
<tr>
<th>MR50-50Z</th>
<th>3i</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>±0.35%</td>
<td>±0.2%</td>
<td>±0.55%</td>
</tr>
<tr>
<td>of full scale</td>
<td>of full scale</td>
<td>of full scale</td>
</tr>
</tbody>
</table>

This translates into a fixed error of up to:

\[0.55\% \times 50 \text{ ozFin} = 0.275 \text{ ozFin}\]

Because accuracy is defined as a percentage of full scale, the fixed error is possible anywhere on the scale from 0 to the capacity. As such, this value represents an increasingly large error as percentage of reading towards the low end of the scale. It is, therefore, recommended that a sensor is selected with capacity as close as possible to the expected load.

The resolution may be different for some sensors depending on whether a 7i, 5i, or 3i indicator is being used. For example, a Series R01 force sensor will display finer resolution when connected to a 5i indicator than when connected to a 3i indicator. Resolution information is shown in the sensors’ user’s guide.

1.4 Safety / Proper Usage

Read through the following safety instructions thoroughly before using the 5i with a sensor:

1. Note the sensor’s capacity before use and ensure that the capacity is not exceeded. Producing a load greater than the indicated safe overload value can damage the sensor. An overload can occur whether the sensor’s indicator is powered on or off.

2. In order to extend the life of the sensor, avoid repetitive shock and impact loading.

3. When moving the sensor to another location, never lift from the cable or strain relief. This can cause damage to the sensor. Always lift the sensor housing itself.

4. Always ensure that load is applied axially with respect to the sensor.

5. Ensure that the sensor is kept away from water or any other electrically conductive liquids at all times.

6. The sensor and indicator should be serviced by a trained technician only. AC power must be disconnected and the indicator must be powered off before the housing is opened.

7. Always consider the characteristics of the sample being tested before initiating a test. A risk assessment should be carried out beforehand to ensure that all safety measures have been addressed and implemented.
8. Typical materials able to be tested include many manufactured items, such as springs, electronic components, fasteners, caps, films, mechanical assemblies, and many others. Items that should not be used with the sensor include potentially flammable substances or products, items that can shatter in an unsafe manner, and any other components that can present an exceedingly hazardous situation when acted upon by a force. Always wear eye and face protection when testing, especially in aforementioned hazardous cases. Extra bodily protection should be worn if a destructive failure of a test sample is possible.

9. In aforementioned hazardous situations, it is strongly recommended that a machine guarding system be employed to protect the operator and others in the vicinity from shards or debris.

10. Sensors have threaded holes or chucks, designed for the mounting of grips, fixtures, or attachments. If any such accessories are used, ensure they are mounted firmly to prevent a potential safety risk to the operator and others in the vicinity. If using an accessory from a supplier other than Mark-10, ensure that it is constructed of suitably rugged materials and components. Similar precautions should be taken when mounting the sensor to a test stand, work bench, or other piece of equipment.

2 POWER

The 5i is powered either by an 8.4V NiMH rechargeable battery or by an AC adapter. Since these batteries are subject to self discharge, it may be necessary to recharge the unit after a prolonged period of storage. Plug the accompanying charger into the AC outlet and insert the charger plug into the receptacle on the indicator (refer to the illustration below). The battery will fully charge in approximately 8 hours.

Caution!
Do not use chargers or batteries other than supplied or instrument damage may occur.

If the AC adapter is plugged in, an icon appears in the lower left corner of the display, as follows:

If the AC adapter is not plugged in, battery power drainage is denoted in a five-step process:

1. When battery life is greater than 75%, the following indicator is present: 
2. When battery life is between 50% and 75%, the following indicator is present: 
3. When battery life is between 25% and 50%, the following indicator is present: 
4. When battery life is less than 25%, the following indicator is present: 

Serial connector

USB connector

Power input jack
5. When battery life drops to approximately 2%, the indicator from step 4 will be flashing. Several minutes after (timing depends on usage and whether the backlight is turned on or off), a message appears, “BATTERY VOLTAGE TOO LOW. POWERING OFF”. A 4-tone audio indicator will sound and the indicator will power off.

The indicator can be configured to automatically power off following a period of inactivity. Refer to the Other Settings section for details.

If battery replacement is necessary, the battery may be accessed by loosening the two captive screws in the rear half of the housing and separating the two halves of the housing.

3 SETUP

3.1 Connecting a sensor
The Plug & Test™ connector must be inserted into the receptacle of the 7i, 5i, or 3i indicator with the side marked “Plug & Test™ Technology” facing up (see Fig. 3.1). When fully inserted, the connector will lock into place with a “click”.

![Fig. 3.1](image)
Appropriate orientation of Plug & Test™ connector. Sensor model number, serial number, and load capacity may be found on the labels affixed to the connector.

To release the connector, press both buttons on either side of the indicator housing to release the sensor (see Fig. 3.2). Pull the connector completely out of the indicator by holding the curved aluminum section. **DO NOT** pull on the cable or strain relief.

![Fig. 3.2](image)
Press both buttons on either side of the indicator housing to release the Plug & Test™ connector.

3.2 Sensor connector orientation
In order to accommodate a variety of testing requirements, the orientation of the Plug & Test™ connector may be set up in either of the two positions shown below. To change the orientation, loosen the two
captive screws on the back side of the housing, separate the two housing halves, rotate one half 180 degrees, and reassemble. Contact between the two halves is made by the spring pins and contact pads on the printed circuit boards.

3.3 Mounting to a plate
The 5i can be mounted to a plate with four thumb screws fastened into the appropriate holes in the rear half of the housing. Refer to the Dimensions section for detailed hole information and locations.

3.4 Installing the USB driver
If communicating via USB, install the USB driver provided on the Resource CD. Installation instructions may also be found on the CD or may be downloaded from www.mark-10.com.

Caution!
Install the USB driver before physically connecting the indicator to a PC with the USB cable.

Further instructions for configuring and using the indicator’s outputs are provided in the Communications and Outputs section.
4 HOME SCREEN AND CONTROLS

4.1 Home Screen

<table>
<thead>
<tr>
<th>No.</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| 1   | Measurement direction indicator | ✸ – indicates compression direction (for force sensors)  
   |                               | ✤ – indicates tension direction (for force sensors)  
   |                               | ⬇ – indicates clockwise direction (for torque sensors)  
   |                               | ⬆ – indicates counter-clockwise direction (for torque sensors)  
   |                               | These indicators are used throughout the display and menu.                                                                                |
| 2   | Peaks                         | The maximum measured compression/tension or clockwise/counter-clockwise readings. These readings are reset by pressing ZERO or by powering the indicator off and on. |
| 3   | Primary reading               | The current displayed load reading. See Operating Modes section for details. If a sensor is not plugged in, this value will be replaced by a message, as follows: SENSOR NOT CONNECTED |
| 4   | Load bar                      | Analog indicator to help identify when an overload condition is imminent. The bar increases either to the right or to the left from the midpoint of the graph. Increasing to the right indicates compression or clockwise load, increasing to the left indicates tension or counter-clockwise load. If set points are enabled, triangular markers are displayed for visual convenience. This indicator reflects the actual load, which may not correspond to the primary reading (depends on operating mode). The ZERO key does not reset the load bar. See Operating Modes section for details. |
| 5   | Units                         | The current measurement unit. Abbreviations are as follows:  
   |                               | **Force units:**  
   |                               | lbF – Pound-force  
   |                               | ozF – Ounce-force  
   |                               | kgF – Kilogram-force  
   |                               | gF – Gram-force  
   |                               | N – Newton  
   |                               | kN – Kilonewton  
   |                               | mN – Millinewton |
### Torque units:
- lbFt – Pound-foot
- lbFin – Pound-inch
- ozFin – Ounce-inch
- kgFm – Kilogram-meter
- kgFmm – Kilogram-millimeter
- gFcm – Gram-centimeter
- Nm – Newton-meter
- Ncm – Newton-centimeter
- Nmm – Newton-millimeter

**Note:** not all sensor models display all the above units. Refer to the capacity / resolution table for the respective sensor series for details.

| 6 | Mode | The current measurement mode. Abbreviations are as follows:
|   |     | RT – Real Time
|   |     | PC – Peak Compression (for force sensors)
|   |     | PT – Peak Tension (for force sensors)
|   |     | PCW – Peak Clockwise (for torque sensors)
|   |     | PCCW – Peak Counter-clockwise (for torque sensors)
|   |     | A – Average Mode
|   |     | ET – External Trigger Mode
|   |     | See Operating Modes section for details about each of these modes

| 7 | Number of stored data points | The number of stored data points in memory, up to 1000. Displayed only if Memory Storage is enabled for the DATA key.

| 8 | Battery / AC adapter indicator | Either the AC adapter icon or battery power icon will be shown, depending on power conditions. Refer to the Power section for details.

| 9 | Automatic data output indicator | If Auto Output has been enabled under Serial / USB Settings, this indicator is displayed. When automatic data output is occurring, the icon becomes animated. See Communications and Outputs section for details.

| 10 | High / low limit indicators | Correspond to the programmed set points. Indicator definitions are as follows:
|    | ▲ – the displayed value is greater than the upper load limit
|    | ▼ – the displayed value is less than the lower load limit
| 11 | Set points | The programmed load limit values. Typically used for pass/fail type testing. One, two, or no indicators may be present, depending on the configuration shown in the Set Points menu item.
4.2 Controls

<table>
<thead>

<td><strong>N/A</strong></td>
<td>N/A</td>
</tr>
</tbody>
</table>

4.3 Menu navigation basics

Most of the indicator’s various functions and parameters are configured through the main menu. To access the menu press **MENU**. Use the **UP** and **DOWN** keys to scroll through the items. The current selection is denoted with clear text over a dark background. Press **ENTER** to select a menu item, then use **UP** and **DOWN** again to scroll through the sub-menus. Press **ENTER** again to select the sub-menu item.

For parameters that may be either selected or deselected, press **ENTER** to toggle between selecting and deselecting. An asterisk (*) to the left of the parameter label is used to indicate when the parameter has been selected.

For parameters requiring the input of a numerical value, use the **UP** and **DOWN** keys to increment or decrement the value. Press and hold either key to auto-increment at a gradually increasing rate. When the desired value has been reached, press **ENTER** to save the change and revert back to the sub-menu item, or press **ESCAPE** to revert back to the sub-menu item without saving. Press **ESCAPE** to revert one step back in the menu hierarchy until back into normal operating mode.

Refer to the following sections for details about setting up particular functions and parameters.

**Note:** As described above, the Plug & Test™ smart connector retains all configuration and calibration data for the sensor, which includes menu settings. As such, a sensor must be connected in order for menu changes to be saved with that particular sensor. If a sensor is not connected and the **MENU** key is pressed, it is possible to browse through the menu parameters and make changes, but changes will not be saved.
5  DIGITAL FILTERS

Digital filters are provided to help smooth out the readings in situations where there is mechanical interference in the work area or test sample. These filters utilize the moving average technique in which consecutive readings are pushed through a buffer and the displayed reading is the average of the buffer contents. By varying the length of the buffer, a variable smoothing effect can be achieved. The selection of 1 will disable the filter since the average of a single value is the value itself.

To access digital filter settings, select Filters from the menu. The display appears as follows:

<table>
<thead>
<tr>
<th>DIGITAL FILTERS</th>
<th>(1 = Fastest)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current Reading</td>
<td>1</td>
</tr>
<tr>
<td>Displayed Reading</td>
<td>1</td>
</tr>
</tbody>
</table>

Two filters are available:

- **Current Reading** – Applies to the peak capture rate of the instrument.
- **Displayed Reading** – Applies to the primary reading on the display.

Available settings: 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, 1024. It is recommended to keep the current reading filter at its lowest value for best performance, and the displayed reading filter at its highest value for best stability.

6  SET POINTS

6.1 General Information

Set points are useful for tolerance checking (pass/fail), triggering an external device such as a motorized test stand, or alarm indication in process control applications. Two limits, high and low, are specified and stored in the non-volatile memory of the instrument and the primary reading is compared to these limits. The results of the comparisons are indicated through the three outputs provided on the 15-pin connector, thus providing “under”, “in range”, and “over” signaling. These outputs can be connected to indicators, buzzers, or relays as required for the application.

6.2 Configuration

To configure set points, select Set Points from the menu. The screen appears as follows:

<table>
<thead>
<tr>
<th>SET POINTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upper Disabled</td>
</tr>
<tr>
<td>* Upper Enabled</td>
</tr>
<tr>
<td>▲ 5.000</td>
</tr>
<tr>
<td>Lower Disabled</td>
</tr>
<tr>
<td>* Lower Enabled</td>
</tr>
<tr>
<td>▼ 3.500</td>
</tr>
</tbody>
</table>

Either one, two, or none of the set points may be enabled. To toggle between the tension and compression (or clockwise and counter-clockwise) directions, press the DIRECTION key.
If two set points have been enabled, they are displayed in the upper left corner of the display. If only one set point has been enabled, the word “OFF” appears in place of the value. If no set points have been enabled, the upper left corner of the display will be blank.

When set points are enabled, the following indicators are shown to the left of the primary reading:

- ▲ – the displayed value is greater than the upper load limit (NO GO HIGH)
- ■ – the displayed value is between the limits (GO)
- ▼ – the displayed value is less than the lower load limit (NO GO LOW)

**Note:** Set point indicators and outputs reference the displayed reading, not necessarily the current live load.

### 6.3 Set Point Outputs Schematic Diagram

![Schematic Diagram](image)

### 6.4 Using Set Points to Control a Mark-10 Test Stand

When using set points to stop/cycle Mark-10 motorized test stands, the upper and lower set points must be set to **opposite** measuring directions. **Both** set points must be set, even if the intended application is to stop/cycle at only one of the set points. The opposite set point should be a value sufficiently large that it does not get triggered during the course of the test.

For certain Mark-10 test stands, the upper and lower set point directions are reversed.
7 OPERATING MODES

Caution!
In any operating mode, if the capacity of the instrument has been exceeded by more than 110%, the display will show “OVER” to indicate an overload. A continuous audible tone will be sounded until the MENU key has been pressed or the load has been reduced to a safe level.

Five operating modes are possible with the 5i indicator. To cycle between the modes, press MODE while in the home screen.

7.1 Real time (RT)
The primary reading corresponds to the live measured reading.

7.2 Peak Compression (PC) / Peak Clockwise (PCW) - for force / torque sensors, respectively
The primary reading corresponds to the peak compression or clockwise reading observed. If the actual load decreases from the peak value, the peak will still be retained in the primary reading area of the display. Pressing ZERO will reset the value.

7.3 Peak Tension (PT) / Peak Counter-clockwise (PCCW) – for force / torque sensors, respectively
Same as above, but for tension / counter-clockwise readings.

7.4 Average Mode (AVG)
Average mode is used to obtain an average load over time. This reading also represents the kinetic coefficient of friction, if the COF unit is selected. Applications include measurement of peel force, COF, muscle strength, frictional force or torque, and other tests requiring time-averaged readings.

Before the parameters of Average Mode can be configured, it must be enabled. To do so, select Average Mode from the menu, scroll to Enabled and press ENTER. The display appears as follows:

```
AVERAGE MODE
  Disabled
  * Enabled
  Stop at Force
  + Settings
```

The averaging function operates in one of two ways:

1. Averaging occurs between the trigger load and defined time limit, as illustrated below:
2. Averaging occurs only while above the trigger load. As the load drops back down to this trigger, averaging stops. To enable this function, scroll to **Stop at Force** and press **ENTER**.

Select **Settings** to configure **Trigger Force**, **Initial Delay**, and **Averaging Time**:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trigger Force or</td>
<td>The minimum load required to start the averaging sequence.</td>
</tr>
<tr>
<td>Start / Stop Force</td>
<td>Toggle between load directions by pressing the <strong>DIRECTION</strong> key. Initial</td>
</tr>
<tr>
<td></td>
<td>delay follows the trigger load. If <strong>Stop at Force</strong> is enabled, this</td>
</tr>
<tr>
<td></td>
<td>parameter is referred to as <strong>Start / Stop Force</strong>, denoting the minimum</td>
</tr>
<tr>
<td></td>
<td>load for which averaging will be active.</td>
</tr>
<tr>
<td>Initial Delay</td>
<td>The time delay, after the trigger load, before the averaging sequence</td>
</tr>
<tr>
<td></td>
<td>commences. Available settings: 0.0 – 300.0 sec., in 0.1 sec. increments</td>
</tr>
<tr>
<td>Averaging Time</td>
<td>The time duration of the averaging sequence. This setting is ignored when</td>
</tr>
<tr>
<td></td>
<td><strong>Stop at Force</strong> is enabled, unless the 300 sec. limit is reached.</td>
</tr>
<tr>
<td></td>
<td>Available settings: 0.1 – 300.0 sec., in 0.1 sec. increments</td>
</tr>
</tbody>
</table>

After the parameters have been configured and the menu has been exited, press **MODE** until **AVG** is displayed. Then press **ZERO**. Average mode is now armed, and the averaging sequence will commence when the trigger load has occurred. The current status of the averaging sequence is displayed below the primary reading, as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>TRIG WAIT</td>
<td>The trigger load has not yet occurred.</td>
</tr>
<tr>
<td>2</td>
<td>INIT DLY</td>
<td>The initial delay is currently taking place.</td>
</tr>
<tr>
<td>3</td>
<td>AVERAGING</td>
<td>The gauge is collecting readings. The status will be flashing until averging</td>
</tr>
<tr>
<td></td>
<td></td>
<td>has been completed.</td>
</tr>
<tr>
<td>4</td>
<td>AVRG DONE</td>
<td>Averaging has been completed. The average load is displayed in the primary</td>
</tr>
<tr>
<td></td>
<td></td>
<td>reading.</td>
</tr>
</tbody>
</table>

At the completion of the averaging sequence, the peak values are retained until **ZERO** is pressed. Another averaging sequence may be started after **ZERO** has been pressed. To exit Average mode, press **MODE** and select the desired measuring mode.

### 7.5 External Trigger (ET)

This mode of operation is useful for measuring electrical contact activation load as well as synchronization of multiple instruments for a "snapshot" view of applied loads. It is possible to capture the reading with a normally open contact (high to low transition of the trigger signal) or a normally closed contact (low to high transition).

Before the parameters of External Trigger Mode can be configured, it must be enabled. To do so, enter the main menu, select **External Trigger**, scroll to one of the four available options and press **ENTER**. The options are as follows:
**EXTERNAL TRIGGER**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Momentary High → Low</td>
<td>The display will freeze the captured reading until ZERO is pressed. Applies to a high to low transition of the trigger signal.</td>
</tr>
<tr>
<td>Momentary Low → High</td>
<td>The display will freeze the captured reading until ZERO is pressed. Applies to a low to high transition of the trigger signal.</td>
</tr>
<tr>
<td>Maintained High</td>
<td>The display will show the captured reading only for as long as a high signal is maintained.</td>
</tr>
<tr>
<td>Maintained Low</td>
<td>The display will show the captured reading only for as long as a low signal is maintained.</td>
</tr>
</tbody>
</table>

After the selection has been made and the menu has been exited, press MODE until ET is displayed. External Trigger mode is now armed. Refer to the pin diagram in the **Communications and Outputs** section for connection information. To exit External Trigger mode, press MODE and select the desired measuring mode.

**Note:** As long as external trigger has been enabled, it is still active even if the indicator is in **Real Time** mode. After the display freezes, any programmed set points will be active. However, if the indicator is in **External Trigger** mode, any programmed set points will be inactive.

### 7.6 External Trigger Schematic

![External Trigger Schematic](image)

### 8 DATA MEMORY AND STATISTICS

The 5i has a storage capacity of 1,000 data points. Readings may be stored, viewed, and output to an external device. Individual, or all, data points may be deleted. Statistics are calculated for the data presently in memory.

To enable memory storage, select **DATA Key** from the menu, then scroll to **Memory Storage** and press ENTER. Then exit the menu. In the home screen, the data record number 0000 appears below the primary reading. Press DATA at any time to save the displayed reading. The record number will...
increment each time DATA is pressed. If DATA is pressed when memory is full the message “MEMORY FULL” will be flashed at the bottom of the display and a double audio tone will be sounded.

To view, edit, and output stored readings and statistics, select Memory from the menu. The screen appears as follows:

<table>
<thead>
<tr>
<th>MEMORY</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Data</td>
</tr>
<tr>
<td>View Statistics</td>
</tr>
<tr>
<td>Output Data</td>
</tr>
<tr>
<td>Output Statistics</td>
</tr>
<tr>
<td>Output Data &amp; Stats</td>
</tr>
<tr>
<td>Clear All Data</td>
</tr>
</tbody>
</table>

8.1 View Data
All the saved data points may be viewed. The record number is displayed, along with the corresponding value and presently set unit of measurement. Any readings may be deleted individually. To do so, scroll to the desired reading and press DELETE. The letter “D” appears to the left of the record number, indicating that the indicator is in Delete mode, as follows:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0001</td>
<td>8.450 Nm</td>
</tr>
<tr>
<td>0002</td>
<td>9.220 Nm</td>
</tr>
<tr>
<td>0003</td>
<td>8.445 Nm</td>
</tr>
<tr>
<td>0004</td>
<td>8.895 Nm</td>
</tr>
<tr>
<td>0005</td>
<td>9.095 Nm</td>
</tr>
<tr>
<td>0006</td>
<td>8.990 Nm</td>
</tr>
<tr>
<td>0007</td>
<td>9.045 Nm</td>
</tr>
</tbody>
</table>

Press ENTER to delete the value. To exit Delete mode, press DELETE again. Any number of readings may be individually deleted, however, all readings may also be cleared simultaneously. Refer to the Clear All Data section for details.

8.2 Statistics
Statistical calculations are performed for the saved values. Calculations include number of readings, minimum, maximum, mean, and standard deviation.

8.3 Output Data
Press ENTER to output data to an external device. The display will show, “SENDING DATA…”, then “DATA SENT”. If there was a problem with communication, the display will show, “DATA NOT SENT”. Saved data can be downloaded by some Mark-10 data collection programs. Refer to their respective user’s guides for details.

8.4 Output Statistics
Press ENTER to output statistics to an external device. The display will show, “SENDING STATS…”, then “STATS SENT”. If there was a problem with communication, the display will show, “STATS NOT SENT”.

8.5 Output Data & Stats
Press ENTER to output data and statistics to an external device. The display will show, “SENDING DATA”, then “SENDING STATS…”, then “DATA SENT”, then “STATS SENT”. If there was a problem with communication, the display will show, “DATA NOT SENT” and/or “STATS NOT SENT”.

8.6 Clear All Data
Press ENTER to clear all data from the memory. A prompt will be shown, “CLEAR ALL DATA?”. Select Yes to clear all the data, or No to return to the sub-menu.
Shortcut for clearing all data: In the main menu, highlight Memory and press DELETE. The same prompt will be shown as above.

For output of data and/or statistics, RS-232 or USB output must be enabled. Data formatting is <CR><LF> following each value. Units can be either included or excluded. Output of data via the Mitutoyo output is possible, however, output of statistics is not. Refer to the Communications and Outputs section for details.

Note: Data is not retained while the gauge is powered off. However, the gauge protects against accidental or automatic power-off. If manually powering the instrument off, or if the inactivity time limit for the Automatic Shutoff function has been reached, the following warning message appears:

*** WARNING ***
DATA IN MEMORY
WILL BE LOST

CANCEL
POWER OFF

If no option is selected, this screen will be displayed indefinitely, or until battery power has been depleted.

9 COMMUNICATIONS AND OUTPUTS

Communication with the 5i indicator is achieved through the micro USB or 15-pin serial ports located at the bottom of the instrument, as shown in the illustration in the Power section. Communication is possible only when the indicator is in the main operating screen (i.e. not in a menu or configuration area).

9.1 Serial / USB
To set up RS-232 and USB communication, select Serial/USB Settings from the menu. The screen appears as follows:

SERIAL/USB SETTINGS
* RS232 Selected
  USB Selected
  + Baud Rate
  + Data Format
  + Auto Output

Select either RS-232 or USB input (output is always simultaneous through both the USB and RS-232 ports). RS-232 must be selected when communicating through a Mark-10 test stand controller. When communicating from the indicator directly to a PC or data collector, either RS-232 or USB can be selected as required. Press DATA to transmit individual data points or to commence an automatic output sequence (see Automatic Output sub-section for details). Single point or continuous data may also be requested via ASCII commands from an external device (see Command Set sub-section for details).

Communication settings are permanently set to the following:

Data Bits: 8
Stop Bits: 1
Parity: None
Other settings are configured as follows:

### 9.1.1 Baud Rate
Select the baud rate as required for the application. It must be set to the same value as the receiving device. When communicating with a Mark-10 test stand controller, the baud rate must be set to 9,600.

### 9.1.2 Data Format
Select the desired data format. The screen appears as follows:

<table>
<thead>
<tr>
<th>Selection</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Numeric + Units</td>
<td>Output format includes the value and unit of measure. Compression/clockwise values have positive polarity, tension/counter-clockwise values have negative polarity.</td>
</tr>
<tr>
<td>Numeric Only</td>
<td>Output format includes the value only. Polarity same as above.</td>
</tr>
<tr>
<td>Invert Polarity</td>
<td>Compression/clockwise values have negative polarity, tension/counter-clockwise values have positive polarity. May be selected in addition to the Numeric + Units / Numeric Only selection.</td>
</tr>
<tr>
<td>Omit Polarity</td>
<td>Both directions are formatted with positive polarity. May be selected in addition to the Numeric + Units / Numeric Only selection.</td>
</tr>
</tbody>
</table>

### 9.1.3 Automatic Output
The indicator has the ability to output data continuously via RS-232 or USB. To enable automatic output, select **Auto Output** from the **Serial/USB Settings** sub-menu. The screen appears as follows:

<table>
<thead>
<tr>
<th>AUTO OUTPUT</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
</tr>
<tr>
<td><strong>Disabled</strong></td>
</tr>
<tr>
<td>Enabled</td>
</tr>
<tr>
<td><strong>Outputs per Sec.</strong></td>
</tr>
<tr>
<td>10</td>
</tr>
</tbody>
</table>

Select **Enabled** to activate automatic output. The number of outputs per second can be set to 1, 2, 5, 10, 25, 50, 125, or 250. The capabilities of the receiving device should be considered when selecting the data output rate.

After the settings have been saved, revert to the home screen. An icon appears in the lower left corner of the display, as follows: 🔄_FWD. This indicates that automatic data output has been armed. Automatic output of data may be initiated by pressing **DATA** or by sending the appropriate ASCII command from an external device (see **Command Set** sub-section for details). The icon will become animated, signaling that automatic output is occurring. Press **DATA** again to end the data transmission.

### 9.2 Mitutoyo BCD settings
This output is useful for connection to data collectors, printers, multiplexers, or any other device capable of accepting Mitutoyo BCD data. Individual data points may be transmitted by pressing **DATA** or by
requesting it from the Mitutoyo communication device (if available). To enable Mitutoyo output, select the
desired format – either with polarity or without polarity. The screen appears as follows:

<table>
<thead>
<tr>
<th>MITUTOYO BCD</th>
</tr>
</thead>
<tbody>
<tr>
<td>* Disabled</td>
</tr>
<tr>
<td>Enabled</td>
</tr>
<tr>
<td>* Without Polarity</td>
</tr>
<tr>
<td>With Polarity</td>
</tr>
</tbody>
</table>

9.3 Analog Output
This output can be used for chart recorders, oscilloscopes, data acquisition systems, or any other compatible devices with analog inputs. The output produces ±1 volt at full scale of the sensor. The polarity of the signal is positive for compression/clockwise and negative for tension/counter-clockwise.

9.4 DATA Key Functions
The DATA key can be configured to perform several functions. To configure the DATA key, select DATA Key from the menu. The display appears as follows:

<table>
<thead>
<tr>
<th>DATA KEY</th>
</tr>
</thead>
<tbody>
<tr>
<td>* RS232/USB Output</td>
</tr>
<tr>
<td>Mitutoyo Output</td>
</tr>
<tr>
<td>Memory Storage</td>
</tr>
</tbody>
</table>

Three options are available:

<table>
<thead>
<tr>
<th>Selection</th>
<th>Function when pressing DATA</th>
</tr>
</thead>
<tbody>
<tr>
<td>RS232/USB Output</td>
<td>Outputs data via the serial and USB ports</td>
</tr>
<tr>
<td>Mitutoyo Output</td>
<td>Outputs data via Mitutoyo (Digimatic) through the serial port</td>
</tr>
<tr>
<td>Memory Storage</td>
<td>Stores a reading to memory (refer to the Memory section for details)</td>
</tr>
</tbody>
</table>

Any combination of the above functions may be selected.

</tr>
</tbody>
</table>

C = compression, T = tension, CW = clockwise, CCW = counter-clockwise
9.6 Command Set / Gauge Control Language 2 (GCL2)
The 5i indicator may be controlled by an external device through the RS-232 or USB channels. The following is a list of supported commands and their explanations. All commands must be terminated by a CR (Carriage Return) character, 0x0D, or a CR-LF (Carriage Return – Line Feed) pair, where the Line Feed, 0x0A, is ignored.

Request Readings
- `?` Request the displayed reading (dependent on operating mode)
- `?C` Request the current (real time) reading
- `?PT` Request the peak tension reading
- `?PC` Request the peak compression reading
- `?CW` Request the peak clockwise reading
- `?CCW` Request the peak counter-clockwise reading
- `?ET` Request the reading obtained during the External trigger mode
- `?A` Request the average reading obtained during the Average mode

Units (available units depend on the sensor used)
- `LB` Switch unit to pound-force
- `OZ` Switch unit to ounce-force
- `KG` Switch unit to kilogram-force
- `G` Switch unit to gram-force
- `N` Switch unit to Newton
- `MN` Switch unit to milli-Newton
- `KN` Switch unit to kilo-Newton
- `LBFT` Switch unit to pound-foot
- `LBIN` Switch unit to pound-inch
- `OZIN` Switch unit to ounce-inch
- `KGM` Switch unit to kilogram-meter
- `KGMM` Switch unit to kilogram-millimeter
- `GCM` Switch unit to gram-centimeter
- `NM` Switch unit to Newton-meter
- `NCM` Switch unit to Newton-centimeter
- `NMM` Switch unit to Newton-millimeter

Basic Functions (available measurement directions depend on the sensor used)
- `CUR` Current mode (real time mode) for primary reading
- `PT` Peak Tension mode for primary reading
- `PC` Peak Compression mode for primary reading
- `PCW` Peak Clockwise mode for primary reading
- `PCCW` Peak Counter-clockwise mode for primary reading
- `CLR` Clear peaks
- `Z` Zero display and perform the CLR function

Filters
- `FLTPn` Digital filter for displayed readings
- `FLTCn` Digital filter for current readings
  $n = 0-10$, filter $= 2^n$, ex: $n=0$: no filter, $n=10$: 1024 samples averaged

Memory & Statistics
- `MEM` Transmit all stored readings
- `STA` Transmit statistics
- `CLRMEM` Delete all stored readings from memory

Set Points
- `SPHD` Disable high set point
- `SPLD` Disable low set point
SPHn  High set point. n=value (+ for C/CW, - for T/CCW)
SPLn  Low set point. n=value (+ for C/CW, - for T/CCW)

**USB/RS-232 Communication**
- FULL  USB/RS-232 transmission with units
- NUM  USB/RS-232 transmission without units (only numeric values)
- AOUTn  Auto-transmit n times per second n=1,2,5,10,25,50,125,250. 0=disabled
  
  **Note:** n = 1 yields 50 times per second. This is provided for backward compatibility with the legacy indicator model BGI.

- IPOLn  Invert polarity of output. n=1=invert polarity. n=0=normal (default)
  
  **Note:** Normal polarity is positive for compression/CW and negative for tension/CCW.

- OPOLn  Omit polarity of output. n=1=omit polarity. n=0=include polarity (default)
  
  **Note:** The “+” sign is always omitted. A “–” sign is sent when polarity is enabled.

**Mitutoyo Communication**
- MIT  Enable Mitutoyo output
- MITD  Disable Mitutoyo output
- POL  Mitutoyo output with polarity (+ for compression, - for tension)
- NPOL  Mitutoyo output without polarity (absolute value)
- PM  Print/send data to a Mitutoyo-compatible device

**Averaging**
- A  Enable Average mode
- AD  Disable Average mode
- AM  Select Average mode (if enabled) for primary reading
- ATn  Average time. n=0.1-300.0 seconds
- DELn  Initial delay. n=0.1-300.0 seconds
- TRFn  Trigger force. n=value (+ for compression/clockwise, - for tension/clockwise)

**External Trigger**
- ETH  Enable high level-triggered External trigger mode
- ETL  Enable low level-triggered External trigger mode
- ETHL  Enable reading captured on a high to low transition
- ETLH  Enable reading captured on a low to high transition
- ETD  Disable External trigger mode

**Input / Output Bits**
- Sn  Set output bit (open drain, pull to ground). n=0,1,2
- Cn  Clear output bit. n=0,1,2
- Rn  Read current status of output bit or level of input pin. n=0,1,2,3

**Personality**
- RN  Read product name
- RM  Read model number
- RV  Read firmware version number
- RS  Read serial number

**Other Commands**
- AOFFn  Auto-shutoff. n=0-30 minutes. 0=auto shutoff disabled
- SAVE  Save current settings in nonvolatile memory
- LIST  List current settings and status
9.7 Command Responses
In response to a reading request command (those which begin with ‘?’) the indicator will return a string
with the load data, followed by a space, then the load unit (if enabled under the Serial/USB Settings →
Data format sub-menu). It will be terminated by a CR-LF pair.

Example return strings:
-18.78 lb<CR><LF> 18.78 lb of counter-clockwise torque
1.724 N<CR><LF> 1.724 N of compression force

The number of digits after the decimal point is dependent of the sensor’s capacity and resolution.

By default, the minus sign (-) indicates tension / counter-clockwise, and the absence of a sign indicates
compression / clockwise. However, positive / negative polarity may be inverted or omitted under the
Serial/USB Settings → Data Format sub-menu.

Following is an example LIST output:
V1.00;LBF;CUR;FLTC8;FLTP1;AOUT00;AOFF5;FULL;IPOL0;OPOL0;MIT;POL;B0

All fields are separated by “;”. The first field shows the firmware version, the last field shows the remaining
battery power (B0=full charge, B3=minimum power). All other fields show the status of settings and
features using the same abbreviations as the commands to set them.

Any detected errors are reported back by means of the following error codes:

*10   Illegal command
*11   Not applicable
*21   Invalid specifier
*22   Value too large
*51   Command string too long (25 characters maximum)

10 CALIBRATION

10.1 Initial Physical Setup
The sensor should be mounted vertically to a test stand or fixture rugged enough to withstand a load
equal to the full capacity of the sensor. Certified deadweights, torque arms/wheels, and/or master load
cells should be used, along with appropriate mounting brackets and fixtures. Caution should be taken
while handling such equipment.

10.2 Calibration Procedure
In the interests of simplicity and brevity, the following instructions use force terminology only. Such
wording is displayed only when a force sensor is being calibrated. When a torque sensor is being
calibrated, the terms COMPRESSION and TENSION are replaced by CLOCKWISE and COUNTER-
CLOCKWISE, respectively.

1. Select Calibration from the menu. The display appears as follows:
The sensor can be calibrated at up to 10 points in each direction. Enter the number of calibration points for each direction (compression and tension or clockwise and counter-clockwise). At least one point must be selected for each direction. For single-direction sensors such as Mark-10’s Series R02, only one direction is allowed.

**Note:** To achieve the accuracy specification of ±0.1% + sensor, it is recommended to calibrate the sensor at 5 or more even increments in both the tension and compression directions. For example, a sensor with capacity of 10 lbF should be calibrated at 2, 4, 6, 8, and 10 lbF loads in each direction.

2. To escape the **Calibration** menu at any time, press **ESCAPE**. The display appears as follows:

   ![Calibration menu](image)

   Selecting “Cancel” will revert back to the Calibration setup. Selecting “Exit w/o saving” will return to the menu without saving changes.

3. After the number of calibration points has been entered, press **ENTER**. The display appears as follows:

   ![Calibration offset menu](image)

4. Place the force sensor horizontally on a level surface free from vibration, then press **ZERO**. The indicator will calculate internal offsets, and the display appears as follows:

   ![Calibration offset calculation](image)

5. The following screen appears after the offsets have been calculated:
Attach weight fixtures (brackets, hooks, etc), as required. Do not yet attach any weights or apply any calibration loads. Press **ENTER**.

6. The display appears as follows:

   CALIBRATION
   COMPRESSION
   
   Optionally exercise the sensor, then press **ENTER**.

Optionally exercise the sensor several times (at full scale, if possible), then press **ENTER**.

7. The display appears as follows:

   CALIBRATION
   COMPRESSION
   
   Apply full scale load
   10.000 lbF +/-20%,
   then press **ENTER**.

Apply a weight equal to the full scale of the instrument, then press **ENTER**.

8. After displaying “Please wait…” the display appears as follows:

   CALIBRATION
   COMPRESSION
   
   Ensure no load,
   then press **ZERO**.

Remove the load applied in Step 8, leave the fixtures in place, then press **ZERO**.

9. The display appears as follows:

   CALIBRATION
   COMPRESSION
   
   Apply load
   1 OF 5
   Enter load:
   2.000 lbF
   Press **ENTER**.
Use the UP and DOWN keys to adjust the load value as required. The load values default to even increments, as indicated by the previously entered number of data points (even increments are recommended for best results). For example, if a 50 lbF capacity sensor is calibrated, and 5 data points were selected, the load values will default to 10, 20, 30, 40, and 50 lb. Apply the calibration load. Then press ENTER.

Repeat the above step for the number of data points selected.

10. After all the compression calibration points have been completed, the display appears as follows:

```
CALIBRATION
COMPRESSION COMPLETE
Reverse direction
for tension.
Attach necessary
weight fixtures,
then press ENTER.
```

Press ENTER.

11. At the completion of the tension calibration, the display appears as follows:

```
CALIBRATION
COMPLETE
Save & exit
Exit w/o saving
```

To save the calibration information, select “Save & exit”. To exit without saving the data select “Exit without saving”.

12. Any errors are reported by the following screens:

```
CALIBRATION
Units must be gF.
Please try again
Press ENTER.
```

Displayed at the start of calibration if a disallowed unit is selected.

```
CALIBRATION
Load not stable.
Please try again.
```

Ensure that the load is not swinging, oscillating, or vibrating in any manner. Then try again.
Causes:

1. The calibration weight does not match the set value.

2. If using a PTA configurable adapter, ensure that the output signal leads (SG+ and SG-) have been installed into the appropriate terminal blocks. Some sensor manufacturers consider SG+ to be a compression value, while others consider it to be a tension value. If the indicator is expecting a compression load but it is receiving a tension signal, calibration cannot continue. Verify that the tension/compression indicator on the home screen properly corresponds to the load direction, and switch the signal leads, if required.

The entered calibration point is too close to the previous point.

11 PASSWORDS

Two separate passwords may be set to control access to the Calibration section and to the menu and other keys. To access the passwords setup screen, select Passwords from the menu. The display appears as follows:

Select “+ More” for additional options:
11.1 Calibration Password
Select Calibration from the sub-menu. The display appears as follows:

CALIBRATION PASSWORD
* Disabled
  Enabled
  Set Password
  (0000 – 9999)

To set the password, select Enabled, then Set Password. Use the UP and DOWN keys to increment and decrement the value, from 0 to 9999. When the desired value has been selected, press ENTER, then ESC to exit the sub-menu.

11.2 Menu Key Password
If enabled, every time the MENU key is selected, a password must be provided. Select Menu Key from the sub-menu. Follow the same procedure as described above.

11.3 Sensor Lock
The indicator may be configured to operate only when a particular sensor is connected. To enable, ensure that the appropriate sensor is connected. Then, highlight Sensor Lock in the sub-menu, and press ENTER.

After configuration, if a different sensor is connected, the display appears as follows:

WRONG SENSOR CONNECTED

Connect sensor
SN  1234567
then press ENTER.

Connect the correct sensor, then press ENTER to continue. If the correct sensor is not available, contact Mark-10 for further instructions.

11.4 Locking Out Other Keys
Other keys may be locked out individually. Select any combination of keys (UNITS, MODE, ZERO, DATA, CLEAR, POWER) by pressing ENTER in the Passwords sub-menu. Pressing a locked key will prompt the message "KEY PROTECTED" instead of performing the key’s function.

11.5 Password Prompts
If passwords have been enabled, the following will be displayed when pressing the MENU key or accessing the Calibration section:

ENTER PASSWORD
(0000 – 9999)

5000
Use the **UP** and **DOWN** keys to select the correct password, then press **ENTER** to continue.

If the incorrect password has been entered, the display appears as follows:

```
INCORRECT PASSWORD

Reset password
Request code:
  XXXX

Press ENTER or ESC
```

To re-enter the password, press **ESCAPE** to exit to the home screen. Then, access the desired function and enter the password again when prompted.

If the password has been misplaced, it can be reset. Press **ENTER** to generate a *request code*. The *request code* must be supplied to Mark-10 or a distributor, who will then provide a corresponding *activation code*. Enter the *activation code* to disable the password.

### 12 OTHER SETTINGS

**12.1 Automatic Shutoff**

The indicator may be configured to automatically power off following a period of inactivity while on battery power. Inactivity is defined as the absence of any key presses or load changes of 100 counts or less. To access these settings, select **Automatic Shutoff** from the menu. The display appears as follows:

```
AUTOMATIC SHUTOFF

* Disabled
  Enabled

Set Minutes
  5
```

Select **Disabled** to disable automatic shutoff. Select **Enabled** to enable it. The length of time of inactivity is programmed in minutes via the *Set Minutes* parameter. Available settings: 5-30, in 5 minute increments.

**Note:** If the AC adapter is plugged in, the indicator will ignore these settings and remain powered on until the **POWER** key is pressed.

**12.2 Backlight**

Although the backlight may be turned on and off at any time by pressing the **BACKLIGHT** key, there are several available initial settings (applicable upon powering on the indicator). To access these settings, select **Backlight** from the menu. The display appears as follows:
Selection Description

<table>
<thead>
<tr>
<th>Selection</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>Backlight to be off upon powering on the indicator.</td>
</tr>
<tr>
<td>On</td>
<td>Backlight to be on upon powering on the indicator.</td>
</tr>
<tr>
<td>Auto</td>
<td>Backlight to be on upon powering indicator, but will shut off after a period of inactivity (as defined in the Automatic Shutoff sub-section). The backlight will turn on again when activity resumes. The length of time of inactivity is programmed in minutes via the Set Minutes parameter. Available settings: 1-10, in 1 minute increments.</td>
</tr>
</tbody>
</table>

Note: If the AC adapter is plugged in, the indicator will ignore these settings and keep the backlight on.

12.3 LCD Contrast
The contrast of the display may be adjusted. Select LCD Contrast from the menu. The screen appears as follows:

Press ENTER to modify the contrast. Select a value from 0 to 25, 25 producing the most contrast.

12.4 Tones
Audible tones can be enabled for all key presses and alerts, such as overload, set point value reached, etc. The Set Point alert can be configured to be either a momentary tone or a continuous tone (until the load is restored to a value between the set points). To configure the functions for which audible tones will apply, select Tones from the menu. The screen appears as follows:

12.5 Initial settings
This section is used to configure the initial settings upon powering on the indicator. The initial units of measurement and the primary reading measurement mode may be configured. To access these settings, select Initial Settings from the menu. The screen appears as follows:
The default unit of measure depends on the sensor series. The default mode is Real Time, regardless of sensor.

12.6 Restore Default Settings
Default factory settings can be restored by selecting Restore Defaults from the menu. The settings may be found in the Specifications section. The screen appears as follows:

RESTORE DEFAULT SETTINGS?

No
Yes

12.7 Information / Welcome Screen
The following screen is displayed at power up and can be accessed at any time by selecting Information from the menu:

Digital Indicator
Model M5i
Ind. SN: 1234567
Sensor: MR51-50
Sensor SN: 9876543
Version: 1.0
13 SPECIFICATIONS

<tr>
<td><strong>Accuracy</strong></td>
<td>±0.1% of full scale + sensor</td>
</tr>
<tr>
<td><strong>Sampling rate</strong></td>
<td>7,000 Hz</td>
</tr>
<tr>
<td><strong>Power</strong></td>
<td>AC or rechargeable battery. Low battery indicator appears when battery level is low, and indicator powers off automatically when power reaches critical stage.</td>
</tr>
</tbody>
</table>
| **Battery life**        | **Backlight on**: up to 7 hours of continuous use  
                          | **Backlight off**: up to 24 hours of continuous use |
| **Measurement units**   | lbF, ozF, gF, kGF, N, kN, mN, lbFt, lbFin, ozFin, kgFm, kgFmm, gFcm, Nm, Ncm, Nmm (depending on sensor) |
| **Outputs**             | USB / RS-232: Fully configurable up to 115,200 baud. Includes Gauge Control Language 2 for full computer control.  
                          | Mitutoyo (Digimatic): Serial BCD suitable for all Mitutoyo SPC-compatible devices.  
                          | Analog: ±1 VDC, ±2% of full scale at capacity.  
                          | General purpose: Three open drain outputs, one input.  
                          | Set points: Three open drain lines. |
| **Weight**              | 0.7 lb [0.3 kg]                              |
| **Included accessories**| Carrying case, AC adapter, battery, USB cable, resource CD (USB driver, MESUR™ Lite software, MESUR™gauge DEMO software, and user's guide), certificate of conformance |
| **Environmental conditions** | 40 - 100°F, max. 93% humidity, non-condensing |
| **Warranty**            | 3 years (see individual statement for further details) |

### 13.3 Dimensions IN [MM]

![Dimensions Diagram]
Mark-10 Corporation has been an innovator in the force and torque measurement fields since 1979. We strive to achieve 100% customer satisfaction through excellence in product design, manufacturing and customer support. In addition to our standard line of products we can provide modifications and custom designs for OEM applications. Our engineering team is eager to satisfy any special requirements. Please contact us for further information or suggestions for improvement.
