Thank you for purchasing a Mark-10 Series 2 digital force gauge, designed for tension and compression force testing applications from 2 to 500 lbF (10 to 2,500 N) full scale. The Series 2 is an essential component of a force testing system, typically also comprising a test stand and grips.

With proper usage, we are confident that you will get many years of great service with this product. Mark-10 force gauges are ruggedly built for many years of service in laboratory and industrial environments.

This User’s Guide provides setup, safety, and operation instructions. Dimensions and specifications are also provided. For additional information or answers to your questions, please do not hesitate to contact us. Our technical support and engineering teams are eager to assist you.

Before use, each person who is to use the Series 2 force gauge should be fully trained in appropriate operation and safety procedures.

1.3 Safety / Proper Usage

**Caution!**

Note the force gauge’s capacity before use and ensure that the capacity is not exceeded. Producing a force greater than 200% of the gauge’s capacity can damage the internal load cell. An overload can occur whether the gauge is powered on or off.

Typical materials suitable for testing include many manufactured items, such as springs, electronic components, fasteners, caps, films, mechanical assemblies, and many others. Items that should not be used with the gauge include potentially flammable substances or products, items that can shatter in an unsafe manner, and any other components that can present an exceedingly hazardous situation when acted upon by a force.

The following safety checks and procedures should be performed before and during operation:

1. Never operate the gauge if there is any visible damage to the AC adapter or the gauge itself.
2. Ensure that the gauge is kept away from water or any other electrically conductive liquids at all times.
3. The gauge should be serviced by a trained technician only. AC power must be disconnected and the gauge must be powered off before the housing is opened.
4. Always consider the characteristics of the sample being tested before initiating a test. A risk assessment should be carried out beforehand to ensure that all safety measures have been addressed and implemented.

5. Wear eye and face protection when testing, especially when testing brittle samples that have the potential to shatter under force. Be aware of the dangers posed by potential energy that can accumulate in the sample during testing. Extra bodily protection should be worn if a destructive failure of a test sample is possible.

6. In certain applications, such as the testing of brittle samples that can shatter, or other applications that could lead to a hazardous situation, it is strongly recommended that a machine guarding system be employed to protect the operator and others in the vicinity from shards or debris.

7. When the gauge is not in use, ensure that the power is turned off.

2 POWER

Caution!
Do not use AC adapters other than supplied or instrument damage may occur.

The gauge is powered either by an 8.4V rechargeable battery or by an AC adapter (input jack is located in the left side of the housing).

If the AC adapter is plugged in, an icon appears in the lower left corner of the display, as follows:

If the AC adapter is not plugged in, battery power drainage is denoted in a five-step process:

1. When battery life is greater than 75%, the following indicator is present: 

2. When battery life is between 50% and 75%, the following indicator is present: 

3. When battery life is between 25% and 50%, the following indicator is present: 

4. When battery life is less than 25%, the following indicator is present: 

5. When battery life drops to approximately 2%, the indicator from step 4 will be flashing. Several minutes after (timing depends on usage and whether the backlight is turned on or off), a message appears, “BATTERY VOLTAGE TOO LOW. POWERING OFF”. An audio tone will sound and the gauge will power off.

The gauge can be configured to automatically power off following a period of inactivity. Refer to the Other Settings section for details.
Battery life is approximately 24 hours with the backlight off, or 7 hours with the backlight on. To change the battery, loosen the two captive screws on the back side of the housing and separate the two housing halves. A foam strip separates the battery from the PCB, as shown in the illustration below:

Ensure that the foam is positioned above the battery when reassembling the housing. Exercise care when reassembling the two halves of the housing, ensuring that internal wires do not interfere.

3 MECHANICAL SETUP

3.1 Loading shaft orientation
In order to accommodate a variety of testing requirements, the orientation of the loading shaft may be oriented in either of the two positions shown below. To change the loading shaft orientation, loosen the two captive screws on the back side of the housing, separate the two housing halves, rotate one half 180 degrees, and reassemble. Exercise care when reassembling the two halves of the housing, ensuring that internal wires do not interfere.
3.2 Mounting to a plate
Although the gauge may be used by hand, proper mounting is important if attached to a fixture or test stand. The round steel insert with a hole in the back of the housing is provided to withstand the load during a test. A mating dowel pin should be used (see illustration below). Mounting plates on Mark-10 test stands include a dowel pin and clearance holes for the four threaded holes located near the corners of the housing. An additional two holes are supplied for metric screws. These holes are designed to accommodate screws in order to hold the gauge in place (Mark-10 test stands include a set of thumb screws for gauge mounting). The screws must not be used for load bearing purposes. Failure to use a dowel pin properly can result in a hazardous situation.

3.3 Mounting attachments to the gauge
The force gauge’s threaded loading shaft is designed to accommodate common grips and attachments with female mounting holes. To mount a grip, gently thread it onto the shaft. Ensure that the grip or fixture is positioned to ensure axial load with respect to the loading shaft of the force gauge. When using a grip, ensure that it secures the sample in such a way that it is prevented from slipping out during a test, preventing a potential safety risk to the operator and others in the vicinity. If using a grip or fixture from a supplier other than Mark-10, ensure that it is constructed of suitably rugged materials and components.

Do not use jam nuts or tools to tighten grips or attachments onto the shaft. **Finger-tighten only.**
4 HOME SCREEN AND CONTROLS

<td>Enters the main menu.</td>
<td>ESCAPE</td>
<td>Reverts one step backwards through the menu hierarchy.</td>
</tr>
<tr>
<td>PEAK</td>
<td>Toggles between real-time and peak measurement modes.</td>
<td>(DOWN)</td>
<td>Navigates down through the menu and sub-menus.</td>
</tr>
</tbody>
</table>

Note: Units are configured through the menu. Refer to the Changing The Units section for details.
4.3 Menu navigation basics
Most of the gauge’s various functions and parameters are configured through the main menu. To access the menu press MENU. Use the UP and DOWN keys to scroll through the items. The current selection is denoted with clear text over a dark background. Press ENTER to select a menu item, then use UP and DOWN again to scroll through the sub-menus. Press ENTER again to select the sub-menu item.

For parameters that may be either selected or deselected, press ENTER to toggle between selecting and deselecting. An asterisk (*) to the left of the parameter label is used to indicate when the parameter has been selected.

For parameters requiring the input of a numerical value, use the UP and DOWN keys to increment or decrement the value. Press and hold either key to auto-increment at a gradually increasing rate. When the desired value has been reached, press ENTER to save the change and revert back to the sub-menu item, or press ESCAPE to revert back to the sub-menu item without saving. Press ESCAPE to revert one step back in the menu hierarchy until back into normal operating mode.

Refer to the following sections for details about setting up particular functions and parameters.

5 OPERATING MODES

Caution!
In any operating mode, if the capacity of the instrument has been exceeded by more than 110%, the display will show “OVER” to indicate an overload.

Three operating modes are possible with Series 2 gauges. To cycle between the modes, press PEAK while in the home screen.

5.1 Real time (RT)
The primary reading corresponds to the live measured reading.

5.2 Peak Compression (PC)
The primary reading corresponds to the peak compression reading observed. If the actual force decreases from the peak value, the peak will still be retained in the primary reading area of the display. Pressing ZERO will reset the value.

5.3 Peak Tension (PT)
Same as Peak Compression, but for tension readings.

6 CHANGING THE UNITS

Series 2 gauges display one of three measurement units. To change the unit, select Units from the menu. The display appears as follows:

```
UNITS
+ lbF
  kgF
  N
```
The gauge will always power on with the unit selected.
7 DIGITAL FILTERS

Digital filters are provided to help smooth out the readings in situations where there is mechanical interference in the work area or test sample. These filters utilize the moving average technique in which consecutive readings are pushed through a buffer and the displayed reading is the average of the buffer contents. By varying the length of the buffer, a variable smoothing effect can be achieved. The selection of 1 will disable the filter since the average of a single value is the value itself.

To access digital filter settings, select Filters from the menu. The display appears as follows:

```
DIGITAL FILTERS
(1 = Fastest)
Current Reading
  8
Displayed Reading
  128
```

Two filters are available:

- **Current Reading** – Applies to the peak capture rate of the instrument.
- **Displayed Reading** – Applies to the primary reading on the display.

Available settings: 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, 1024. It is recommended to keep the current reading filter at its lowest value for best performance, and the displayed reading filter at its highest value for best visual stability.

8 CALIBRATION

8.1 Initial Physical Setup
The gauge should be mounted vertically to a test stand or fixture rugged enough to withstand a load equal to the full capacity of the instrument. Certified deadweights or master load cells should be used, along with appropriate mounting brackets and fixtures. Caution should be taken while handling such equipment.

8.2 Calibration Procedure

1. Select Calibration from the menu. The display appears as follows:

```
CALIBRATION
To invert the display, press the DIRECTION button, then press ENTER
```

2. Press DIRECTION to invert the display, if desired. ENTER to continue. The display appears as follows:
The gauge can be calibrated at up to 10 points in each direction. Enter the number of calibration points for each direction (compression and tension). At least one point must be selected for each direction.

**Note:** To achieve the accuracy specification of ±0.5%, it is recommended to calibrate the gauge at 5 or more even increments in both tension and compression directions. For example, a gauge with capacity of 10 lbF should be calibrated at 2, 4, 6, 8, and 10 lb loads in each direction.

3. To escape the Calibration menu at any time, press **ESCAPE**. The display appears as follows:

```
CALIBRATION
Enter # cal points
(1 to 10)
Compression:
5
Tension:
5
```

Selecting “Cancel” will revert back to the Calibration setup. Selecting “Exit without saving” will return to the menu without saving changes.

4. After the number of calibration points has been entered, press **ENTER**. The display appears as follows:

```
CALIBRATION
OFFSET
Place force gauge horizontally, then press ZERO
```

5. Place the force gauge horizontally on a level surface free from vibration, then press **ZERO**. The gauge will calculate internal offsets, and the display appears as follows:

```
CALIBRATION
OFFSET
Please wait…
```
The following screen appears after the offsets have been calculated:

6. Attach weight fixtures (brackets, hooks, etc), as required. Do not yet attach any weights or apply any calibration loads. Press ENTER.

7. The display appears as follows:

Optionally exercise the load cell shaft several times (at full scale, if possible), then press ENTER.

8. The display appears as follows:

Apply a weight equal to the full scale of the instrument, then press ENTER.

9. After displaying “Please wait…” the display appears as follows:

Remove the load applied in Step 8, leave the fixtures in place, then press ZERO.
10. The display appears as follows:

   CALIBRATION
   COMPRESSION
   Apply load
   1 OF 5
   Enter load: 2000 lbF
   Press ENTER

Use the **UP** and **DOWN** keys to adjust the load value as required. The load values default to even increments, as indicated by the previously entered number of data points (even increments are recommended for best results). For example, if a 50 lbF capacity gauge is calibrated, and 5 data points were selected, the load values will default to 10, 20, 30, 40, and 50 lb. Apply the calibration load. Then press **ENTER**.

Repeat the above step for the number of data points selected.

11. After all the compression calibration points have been completed, the display appears as follows:

   CALIBRATION
   COMPRESSION COMPLETE
   Reverse direction
   for Tension
   Attach necessary
   weight fixtures,
   then press ENTER

Press **ENTER**.

12. The display appears as follows:

   CALIBRATION
   To invert the
   display, press the
   DIRECTION button,
   then press ENTER

Reverse the orientation of the load cell shaft by rotating the gauge 180 degrees. Press **DIRECTION** to invert the display. Then attach weight fixtures. The following screens will step through the same procedure as with the compression direction. Proceed in the same manner.

13. At the completion of the tension calibration, the display appears as follows:

   CALIBRATION
   COMPLETE
   Save & exit
   Exit without saving

To save the calibration information, select "Save & exit". To exit without saving the data select "Exit without saving".
14. Any errors are reported by the following screens:

CALIBRATION
Units must be gF
Please try again
Press ENTER

Displayed at the start of calibration if a disallowed unit is selected.

CALIBRATION
Load not stable
Please try again

Ensure that the load is not swinging, oscillating, or vibrating in any manner. Then try again.

CALIBRATION
COMPRESSION
Load too low
Please try again

The calibration weight does not match the set value.

CALIBRATION
TENSION
Load too close to previous
Please try again

The entered calibration point is too close to the previous point.
9 OTHER SETTINGS

9.1 Automatic Shutoff
The gauge may be configured to automatically power off following a period of inactivity while on battery power. Inactivity is defined as the absence of any key presses or load changes of 100 counts or less. To access these settings, select **Automatic Shutoff** from the menu. The display appears as follows:

<table>
<thead>
<tr>
<th>Selection</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disabled</td>
<td>Disable automatic shutoff.</td>
</tr>
<tr>
<td>Enabled</td>
<td>Enable automatic shutoff.</td>
</tr>
<tr>
<td>Set Minutes</td>
<td>The length of time of inactivity. Available settings: 5-30, in 5 minute increments.</td>
</tr>
</tbody>
</table>

**Note:** If the AC adapter is plugged in, the gauge will ignore these settings and remain powered on until the **POWER** key is pressed.

9.2 Backlight
Several initial settings are available, upon powering on the gauge. To access these settings, select **Backlight** from the menu. The display appears as follows:

- **Backlight**
  - Off
  - On
  - Auto

Select **Off** for the backlight to be off upon powering on the gauge.

Select **On** for the backlight to be on upon powering on the gauge.

Select **Auto** for the backlight to be on upon powering gauge, but will shut off after a period of inactivity (as defined in the **Automatic Shutoff** sub-section). The backlight will turn on again when activity resumes. The length of time of inactivity is programmed in minutes via the **Set Minutes** parameter. Available settings: 1-10, in 1 minute increments.

**Note:** If the AC adapter is plugged in, the gauge will ignore these settings and keep the backlight on. Selecting the **On** or **Off** setting in the **Backlight** menu will manually turn the backlight on or off as if the Backlight key were pressed.

9.3 LCD Contrast
The contrast of the display may be adjusted. Select **LCD Contrast** from the menu. The screen appears as follows:
9.4 Initial Mode
This section is used to configure the initial mode upon powering on the gauge. To access this parameter, select Initial Mode from the menu. The screen appears as follows:

The default value is Real Time.

9.5 Restore Default Settings
Default factory settings can be restored by selecting Restore Defaults from the menu. The settings may be found in the Specifications section. The screen appears as follows:

9.6 Information / Welcome Screen
The following screen is displayed at power-up and can be accessed at any time by selecting Information from the menu:
10 SPECIFICATIONS

Mark-10 Corporation has been an innovator in the force and torque measurement fields since 1979. We strive to achieve 100% customer satisfaction through excellence in product design, manufacturing and customer support. In addition to our standard line of products we can provide modifications and custom designs for OEM applications. Our engineering team is eager to satisfy any special requirements. Please contact us for further information or suggestions for improvement.
